

Project Proposal

Household Energy Conservation Tracker

Prepared by:

Zaiden Quinn A. Olaguera

8 - Ilang-Ilang

I. Problem Statement

Millions of households waste energy yearly due to negligence and misuse of electricity. Most of the households consume electricity daily without having any idea about the amount of energy being consumed by their electrical appliances. Using the electrical appliances unnecessarily can result in an increased consumption of electricity and cost of money at the household. Acknowledging a real world problem such as this is significant in the conservation of the planet. This project is to assist the households to monitor their electrical appliance usage.

II. Project Objectives

1. To assist users in determining the appliances that consume most electricity.
2. To estimate and monitor the amount of electricity used by the electrical appliances at home through their electricity consumption rate and time of usage.
3. To encourage efficient electricity usage and energy conservation for users.

III. Planned Features

- Energy Consumption Tracker - Record the electronic appliances and their usage
- Appliance Usage Evaluator
- Usage Total Calculation and Summary
- Energy Conservation Suggestions

IV. Planned Inputs and Outputs

The user will **input** the following:

- Electrical Appliance Name
- Electricity Consumption Rate
- Average Time of Usage

The system would **output** the following:

- Energy Consumption of Each Appliance
- Total Electricity Used
- Identified Top Appliances with Highest Consumption
- Energy Conservation Suggestions

V. Logic Plan

Ask the user for the amount of appliances

For every appliance:

 Ask for the name

 Ask for the consumption rate

 Ask for the time used

 Calculate the electrical consumption of the appliance

Output electrical consumption of the

Output the total sum of the energy use of all appliances

Output the identified top energy consumers within the appliances

Output energy conservation suggestions
